A BEAUTIFUL LAWN IS AN ASSET
TO ANY PROPERTY

Price's Permanent Lawn Grass Seed

The best time to start your lawn, or to repair it, is during the cool weather of early Spring or in early Fall. The weather at these times is favorable for the development of domestic grass but unfavorable for most weeds and wild annual grasses.

SPECIAL (High Grade)

Our mixture is especially prepared from the highest quality seeds that can be produced. It makes a smooth, green, velvety lawn with a thick bottom, free from clumps. Only the very best fine-leaved and deep-rooted varieties of the most suitable grasses for making an even, thick mass of sod are used in this mixture. Sure to produce the best results under average conditions of soil and climate. A small quantity of white Clover is included.

Lb. 65c., 5 lbs. \$2.95, 10 lbs. \$5.75, 25 lbs. \$13.75, 100 lbs. \$49.50

FOR SHADY AREAS **Price's Mixture of Grasses**

Shaded lawns are a problem. Mixtures for such locations should consist of varieties which will grow vigorously with little sunlight and in soils deficient in plant food and moisture.

While it is impossible to maintain a permanent lawn in certain shady locations, such as under soft maple trees, we have combined in this mixture certain grasses that are more resistant to these harsh conditions. We recommend this mixture to be especially prepared for shady locations. Sow 1 lb. to 100 square feet (10x10 feet).

Lb. 70c., 5 lbs. \$3.20, 10 lbs. \$6.00, 25 lbs. \$14.00, 100 lbs. \$54.00

GRASSES FOR SPECIAL PURPOSES

WHITE DUTCH CLOVER. Gardeners who prefer an extra heavy growth of clover in their lawn should add this at the rate of 4 ozs. to every 2 lbs. of grass seed. SEA SIDE BENT (Certified). Being offered under various names. Was first recognized in Oregon. A very desirable variety, being a vigorous creeper of rapid growth, forms a compact sward and suitable for putting greens. Lb. \$1.65, 2 lbs. \$3.15, 5 lbs. \$7.50, 10 lbs. \$14.50

RYE GRASS (For Quick Covering). Excellent where a nurse grass is wanted as it will make a quick covering of bright green grass on new lawns and protect the slower germinating permanent kinds. ONE OF THE OLDEST SEED STORES IN THE U.S.A.

For One Hundred and Fourteen Years **PRICE'S SEED STORE** has served the Market Gardeners and Florists of New York State and the adjoining states, handling the finest quality of seeds. We aim to please and therefore put forth our best efforts.

All our seeds are grown for us by the most competent growers, and the strains without exception are of the highest perfection. They are carefully tested for germination and purity. The germination is marked on every package of **PRICE'S** seeds.

No seeds are sold by us that we do not know are of good vitality and will grow under normal conditions.

ORDER NOW—We Appreciate Early Orders. Orders may be sent at any time and goods will be shipped at the time specified on the order.

USE THE ORDER SHEET, as you will help us by so doing. If you write us a letter, write it on a separate paper, not on the order sheet. If your express or freight office is different from your post office, give both. Please **print** your name and address.

WHEN CASH ACCOMPANIES THE ORDER—we prepay delivery charges to any point in the United States on all flower and vegetable seeds at packet, ounce or pound prices and on all the bulbs purchased at quoted catalog prices.

ACCOUNTS—We would be pleased to open charge accounts for the convenience of our customers. Kindly furnish references.

REMITTANCES—should be made by Money Order, Bank Draft or Registered Letter. We must decline sending goods C.O.D. unless 25% of their value accompanies the order. **If cash or stamps are sent by mail, register the letter.** Make checks payable to **PRICE'S SEED STORE.**

PRICES in this catalog are subject to change without notice. Prices of certain kinds of seeds are subject to Maximum Price Regulations of the Office of Price Administration, and to the best of our belief all prices herein are in accordance with such maximum price regulations.

CONDITIONS OF SALE—We guarantee safe delivery on all our shipments. Price's Seed Store has exercised reasonable precautions in the production and distribution of the seed, but cannot be responsible for the operation of Nature's laws nor govern the conditions under which the crop is grown. Therefore upon the acceptance of this seed, it is mutually agreed that Price's Seed Store gives no warranty, express or implied, as to the productiveness of any seeds, bulbs, plants or roots it sells, and will not be in any way responsible for the crop. Our liability in all instances is limited to the purchase price of the seed.

MATURITY DATES—We assume no responsibility for the accuracy of the number of days allotted to each variety. It should be emphasized it is relative and intended primarily to afford a basis of comparison rather than to state a rigid interval between planting and harvest, which is obviously conditioned by many variable factors. In the case of Cabbage, Cauliflower, Celery, Eggplant, Pepper and Tomato, the maturity dates show time from setting of plants in the field to crop harvest.

It is not possible for you to obtain seeds of purer strains or of higher germination.

Our seeds have had an enviable record for quality since 1831. We have jealously guarded that record and intend to maintain it. We solicit your orders, confident that we can please you.

Vegetable Seeds

FOR MARKET GARDENERS

Every successful market grower realizes the tremendous importance quality seeds play in the production of profitable crops. The market gardener who makes his livelihood from the sale of the produce grown cannot afford to sow seeds of doubtful value. He must have highly bred strains carefully selected from vigorous parent plants that show all the typical characteristics of the true variety. They must be full of vigor and vitality to make a sturdy growth from the start. More than three generations of market growers have realized that they can depend on PRICE'S to supply them with the finest in Vegetable Seeds.

Our list of varieties includes the choicest strains of all the best standard sorts but we recommend making thorough trials of the many new varieties because they have proved superior in many sections. Higher yields, better quality, and disease resistance are important factors that distinguish many of the newer varieties.

Asparagus, Mary Washington

Asparagus Seeds

Sow seed in early Spring in rows $1\frac{1}{2}$ to 2 feet apart, spacing the seed 1 inch apart in the row, and firmly cover with 1 inch of fine soil. Keep free from weeds at all times. A packet will produce about 200 roots, cz., 750; 4 to 5 lbs. to the acre.

MARY WASHINGTON. This variety has proven to be highly rust resistant, hardy and productive. The shoots are long, straight, thick and heavy, dark green the entire length, except tinted darker at the tips. Introduced by Prof. Norton of the U. S. Dept. of Agriculture. Our seed is the true strain and will produce the finest large stalks. Pkt. 10c., oz. 20c., $\frac{1}{4}$ lb. 45c., lb. \$1.35

Palmetto. Of very large size, even and regular in growth and appearance. A very early sort immensely productive and of the best quality. Pkt. 10c., oz. 15c., $\frac{1}{4}$ lb. 35c., lb. \$1.00

Asparagus Roots

Set out in April—Fresh dug—Not cold storage roots

Dig or plow out a trench 15 to 18 inches deep, put in plenty of well-rotted manure, covering it with a few inches of soil, then set the roots $1\frac{1}{2}$ to 2 feet apart and cover with 4 inches of soil. In the Fall, cut off and burn the top growth, plow or throw down the earth and give a good application of stable manure. Early in the Spring fork this in and apply ground animal bone. If White Asparagus is wanted draw earth around the stalks as they grow. Do not continue cutting too long, as this exhausts the plants. 100 roots plant about 15x50 feet, 5,000 to 7,000 will plant an acre.

Washington Rust-Resistant Roots. 2-yr.-old strong plants that will make you a profitable crop second year. *Postpaid*, 100 roots \$3.50, 250 \$5.00
Not prepaid, 500 roots \$9.00, 1000 \$18.00

BROCCOLI

Culture same as for Cauliflower. Italian Broccoli much resembles a green-headed Cauliflower. The true Italian Broccoli produces one head on its main stalk. When this has been cut smaller heads appear, which are also marketed. 1 oz. of seed will produce 2000 plants.

Italian Green Sprouting (Calabrese). This variety produces a large head, like Cauliflower, consisting of a compact cluster of bluish green flowers. When the central head is removed, the plant produces many branches, each bearing small heads. These are cut with 3 or 4 in. of the branch attached and tied in bunches for market. The stems as well as the flower heads are cooked and served as Cauliflower. 70 days.

Pkt. 15c., oz. 75c., $\frac{1}{4}$ lb. \$2.00, lb. \$6.00

Broccoli, Italian Green Sprouting

Di Rapa. For Spring sowing. Forms a compact top growth and bears a yellow blossom before going to seed. Known also as Caledonia Turnip, this variety is relished for its Turnip like leaves and small flower heads which are eaten as greens.

Pkt. 10c., oz. 25c., $\frac{1}{4}$ lb. 60c., lb. \$1.75

Brussels Sprouts

BRUSSELS SPROUTS

The most delicately flavored vegetable of the entire Cabbage family. Plants grow medium tall and produce an abundance of large, solid, dark green, tightly folded "sprouts" or little Cabbage-like heads along the stem. Grow in moderately rich soil to avoid an excess of leaves. Sow seed in May in the open ground. Transplant in rows 3 feet apart and 18 inches apart in the row. When the "sprouts" begin to form at the base of the stalk, break off the lower leaves to give them more room for growth. A packet of seed produces about 300 plants.

1 oz., 3000 plants; 4 to 6 ozs. to plant an acre.

Long Island Strain (A Special Dwarf Selection). This is a fine strain of Sprouts, grown extensively for the New York market, where they bring a good price, especially during the Winter. The plants produce a large crop. 70 days. Pkt. 25c., $\frac{1}{2}$ oz. 60c., oz. \$1.00, $\frac{1}{4}$ lb. \$3.40, lb. \$12.00

BEANS

Yellow-Pod Bush Varieties

Plant seed when all danger of frost is past and the soil is quite warm, in rows 18 to 30 inches apart for hand cultivation, or $2\frac{1}{2}$ to 3 feet apart for field culture. Space the seed 2 to 3 inches apart in the row and cover with 1 to 2 inches of soil. Give frequent and shallow cultivation until blossoms appear. A packet will plant about 25 feet of row; 1 lb., 100 feet; 60 lbs. to an acre. You can make your Bean crop most effective if you plant seed at intervals of two weeks until about 10 weeks before the first frost. In that way you can have plants in full production constantly, providing a steady supply for both table and canning purposes. Remember, Beans have the best flavor when served or canned soon after picking.

BUSH LIMA

The Bush Lima is more easily grown than the tall, and is earlier and more economical of space but the Pole Limas yield better. Lima Beans require even more heat than other Beans. They should not be planted until the ground is thoroughly warmed. Bush Limas should be sown on good garden soil in 2½ to 3 feet rows, 3 to 6 inches apart, eye down, cover 1 inch. 1 lb. will plant 75 feet, 1 bu. to the acre (60 lbs.) Do not brush against Bean foliage when wet.

Bean, Fordhook Bush Lima

FORDHOOK BUSH. 70 days. Outstanding Bush Lima for home or market, producing a very heavy crop with large, fat pods in clusters of from 5 to 8, and contains 3 to 5 thick, meaty, plump beans of excellent flavor. The sturdy, vigorous plants grow 24 to 30 in. high, spread out nearly 2 ft. and stand up well against wind and rain. They begin to bear early and continue to produce for a long time. Because of its earliness, the large size of the Bean, and long bearing season this strain is most popular and it is especially appreciated in sections where the Summers are comparatively short. Fordhook always outsells other Bush Limas.

BEETS

Beets should be sown early in the Spring, as soon as the ground can be worked. Successive plantings may be made till the end of July. Beets thrive best in light, loose, deeply worked soil that has been enriched for a previous crop. Smooth roots cannot be grown if fresh manure is used.

The seed should be sown thinly in drills from $\frac{1}{2}$ to 1 inch in depth, leaving 12 inches or more between the rows to admit cultivation. When well started,

thin the plants to stand 3 to 4 inches apart in the row. 1 oz. will sow 50 feet of drill, 4 to 6 lbs. are needed per acre in drills.

Our beet seed is grown only from transplanted roots, which are taken up in Fall, carefully graded, stored over the Winter and transplanted again in the Spring. Only Beets which conform to the highest quality standards are planted for seed. Thus improvement is shown annually.

PRICE'S EARLY WONDER. Most popular early bunching Beet. To satisfy critical growers who, demand an ideal in shape, color and season, is quite a difficult matter. Ideals vary considerably, but we have pleased a very critical trade with our stock of Early Wonder Beet. The shape is a flattened globe, flesh tender, sweet, and attractive, deep red with very indistinct zones—particularly light zones so undesirable in many stocks; tops small and slender. In season it is about 53 days from seeding to market stage. *Prepaid:* Pkt. 10c., oz. 20c., $\frac{1}{4}$ lb. 70c., $\frac{1}{2}$ lb. \$1.15, lb. \$2.25.

One ounce will produce about 3,000 plants, 4 ozs. will produce enough for an acre.

Our strains are the very best to be had, selected from specimen heads in well rogued fields. Sow seeds of the early varieties in February in hotbeds and transplant the latter part of April or early in May to open ground, or an

early sowing in open ground can be made as soon as weather will permit. Set the plants in rows 3 feet apart and 12 to 18 inches apart in the row. The second early varieties sow in April and transplant in May; late varieties, sow in May and transplant in July, setting plants in rows 3 feet apart and 2 feet in rows. Never plant Cabbage in the same location two years in succession.

Our Celery Seed Stock is Especially Selected for Eastern Conditions

CELERY

For the earliest crop, start the seed in a hotbed or in the house during February or March. For the Fall or main crop, sow the seed in the open ground as early in the Spring as the soil can be worked into good condition. Cover seed with no more than $\frac{1}{4}$ inch of fine soil. Celery requires a rich, well-manured soil and plenty of moisture for best results. Soil, boards, or Celery paper may be used to blanch the stalks. A packet of seed will produce about 400 strong plants, 1 oz. about 7,500 plants, $\frac{1}{4}$ lb. for an acre. Treat seed with Cuproside or Semesan to prevent damping-off of the seedlings.

MARKETER. (1942 All-America Selection). Outstanding characteristics of this new variety are its earliness, its trim shape and rich deep green color which is carried right down to the blossom end of the fruits. The vines are very prolific and have shown less damage from mosaic than standard varieties grown in close proximity, possibly due to their undoubtedly vigorous habit of growth. An interesting feature is the larger than usual proportion of female blossoms which contributes both to earliness and to yield. The fruits are not quite so long as some of the slicing varieties commonly grown, and to most home gardeners this will be an attraction since one of these handy sized Marketer fruits is more likely to be completely used up at a time. From the market grower's point of view, its earliness, uniformity of size and heavy yield will be of importance in addition to the appeal it will make to the buyer's eye. The Blue Ribbon award to Marketer is a new departure in the All-America Selections, its purpose being to indicate the highest ranking in the trials, regardless of the type of medal awarded. This is an Asgrow creation. 65 days. Pkt. 10c., oz. 30c., $\frac{1}{4}$ lb. \$1.00, lb. \$3.50, 10 lbs. \$34.00

National Pickling. 56 days. Developed by the Michigan Agricultural College under the supervision of the National Pickle Packers Association. Pkt. 10c., oz. 20c., $\frac{1}{4}$ lb. 50c., lb. \$1.75, 10 lbs. \$16.50

Price's Hybrid. Valuable for market garden and shipping; a main crop sort, prolific and attractive. Fruits weigh $2\frac{1}{4}$ lbs.; dark green, fairly uniform, with rounded ends. 64 days.

New Introduction

Cubit Cucumber

The latest Bronze Medal award has been won by a new, long slicing Cucumber, to be known by the easily remembered name of Cubit.

Cubit is a prolific, white spined variety distinguished by unusually uniform dark green exterior color and long, blunt-ended cylindrical shape. The interior has smooth, crisp texture with small seed area and it is admirably adapted for slicing. It does not quickly "flag down" but holds its fresh quality well, which is an important factor for market growers. Cubit is a main crop long slicing variety; when grown under proper conditions, the deep green exterior color is carried down to the blossom end, with negligible signs of striping.

Pkt. 10c., oz. 45c., $\frac{1}{4}$ lb. \$1.25, lb. \$4.00, 10 lbs. \$35.00

The 5-ft. stalks produce 8-in., 10- to 14-rowed, golden yellow ears well filled to the tip in 74 days, or almost as early as Golden Early Market. As both parents are highly disease-resistant, Marccross C13.6 is double protected.

This is the genuine Stanley's Crow Repellent which we have handled for years. As a protection against the loss of Corn, this has no equal. Crows simply will not touch Corn that has been treated with this Crow Repellent. It has the advantage of not clogging a Corn planter, nor is it necessary to dry the Corn after treatment.

At a cost of 15c. to 20c. per acre you can protect your Corn against crows, pheasants, squirrels, and other pests.

HOTBEDS

If you want to produce earlier vegetables and flowers than your neighbor, make a hotbed. It should be started any time after February 15th. The hotbed consists of a subframe, which extends 15 to 20 inches beneath the soil, depending upon the climate, and a top frame which slopes down from 18 inches to 12 inches towards the south. This is covered with a glass sash, which keeps in the heat. These come in standard size, 3x6 feet. The most commonly used material for producing heat is fresh horse manure. Two parts of it mixed with one part of litter, consisting of either leaves or straw will prevent the manure from getting hot too suddenly or not heating at all. Before putting it in the frame it should be piled outdoors in heaps. As long as it steams it should be turned over every two or three days. This should be repeated until the manure steams only every other day. Then a 5 or 6 inch layer of manure should be placed evenly in the pit, and should be tramped down firmly. On top of this comes a mass of 4 to 6 inches of soil, which has not been frozen. A careful gardener puts some litter or manure on the sides of the frame also, extending to the top. By doing so he helps to maintain the temperature within.

Three things are necessary for success with a hotbed. Regular watering, timely ventilation and frequent weeding. Never sow seeds or set in plants before the temperature has settled down to 90 degrees or less.

Cold Frames and Seed Flats

After plants have reached the size that makes removing from the hotbed necessary they may be transplanted into the coldframe, before being set in the open ground. The coldframe is really a hotbed minus the heat, and for that reason need not have a sub-frame.

Those who have no room for either hotbed or coldframe may still "beat the neighbor to it" with the help of a seed flat and a sunny kitchen window. A seed flat is a shallow box, about 3 or 4 inches deep.

From there set out in the garden as soon as the soil is warm, placing the plants 5 to 7 inches apart in rows while the rows should be 12 to 18 inches apart. Where there is no hotbed, sow seed outside when ground is warm and transplant. For looseleaf or curly-leaved sorts, sow the seed either broadcast or in rows; make sowings every couple of weeks for Lettuce all Summer, and cut as it comes. By sowing in rows the plants can be cultivated. Sow seed the last of August and in September to be transplanted to the coldframe in October. One ounce will sow 300 feet of row, 4 to 5 lbs. for an acre.

PEAS

Peas succeed best on rather light rich loams, but will thrive in any good soil that has been deeply plowed or spaded and liberally manured. They dislike an acid soil and if such a condition exists, an application of lime is essential. Make the first sowing just as early in the Spring as the ground is workable—during March if possible.

The dwarf early Peas are sown in rows 2 feet apart, the larger and midseason varieties in rows 3 feet apart and the tall varieties in rows 4 feet apart, the seed should be covered about 2 inches and the plants thinned to 2 inches apart in the row.

2 lbs. of Peas will sow 100 feet of drill, 120 lbs. to an acre

PRICE'S NORTHERN GROWN PEPPER SEED

ALL OUR SEEDS ARE GROWN FOR US BY THE MOST COMPETENT GROWERS, AND THE STRAINS WITHOUT EXCEPTION, ARE OF THE HIGHEST PERFECTION

RADISHES

Radishes must grow quickly to be good, especially the small early sorts. The soil should therefore be thoroughly prepared. Start to sow right after frost is gone, at intervals of 10 days or so to insure a constant supply. Thin to 24 plants to the foot. If crowded, they run to leaves without making roots. Many gardeners sow the early sorts in the rows of slow-growing crops. The Summer and Winter varieties should be thinned to six to the foot; Winter varieties should not be sown until August. One ounce will sow 100 feet of row, 8 lbs. will sow an acre in drill, 12 lbs. broadcast. Our Radish Seed is strictly of the finest grade, being grown from carefully selected and transplanted roots.

PRICE'S SCARLET GLOBE (Special Strain) (Medium Top). 21 days. Globe-shape, exceptionally fine, bright scarlet color. SPINACH

Rich In All Health
Giving Properties

Price's

Spinach can easily be grown in the Spring and Fall. Make first sowing as early as possible, and repeat at intervals until June 1. For Fall use, seeding may be made from August 1 to September 15. To Winter over for Spring use, sow from September 10 to October 5, according to the season. Rows should be 1 foot apart, and plants about 2 inches apart in the row. One ounce will sow 100 feet of row; 15 lbs. will sow an acre in rows; 25 lbs. will sow an acre if broadcast. Spinach develops best and is most tender and succulent when grown in rich soil and in cool weather; during the Summer it often bolts to seed.

TOMATO

Tomato, Valiant

Sow the seed in February or March in a hotbed, greenhouse or in shallow boxes in the house. When plants are about 2 inches high, transplant to 4 inches apart. Transplant in the open ground after all danger of frost is past, 3 to 4 feet apart each way. Cultivate frequently. When plant has reached a height of 5 feet, cut off the top. When three or four clusters of fruit have formed and some of the fruit is as large as a silver dollar, prune the leaves at the base one-half. This hastens ripening. Once a month apply sheep manure around each plant. One ounce will produce 2,000 to 3,000 plants, 2 to 3 ounces for an acre; 35 to 40 plants to 100 feet of row.

Green Mountain Potatoes

Chippewa. An attractive Potato, smooth, slightly flattened oval with shallow eyes, similar in appearance to Green Mountain, but earlier. Cooks very white and is good quality. Many growers are increasing their acreage on this, for it is profitable and sells readily after the main digging of cobbles.

Katahdin. This new Potato has become well established as a standard late or main crop variety. It matures a little later than Green Mountain but before the Rural Russet. The tubers are white skinned, handsome in appearance and have shallow eyes. This variety has been outstanding in the large percentage of good marketable Potatoes it produces. Does best on light upland soil or muck land.

Maine Grown SEED POTATOES

(CERTIFIED SEED)

Potatoes are a most important crop to every gardener and care should be taken to plant strong healthy, disease-free stock. A rich, sandy loam containing plenty of humus will give the best crops. Cut the tubers to 1 or 2 eyes. Plant in rows 3 feet apart, and drop 15 to 18 inches apart in row. Cover the tubers or divisions 4 inches deep. From 10 to 12 bushels of Potatoes are needed to plant one acre.

Red Bliss. To those who prefer a Potato with a pink skin and white flesh, or those who grow for markets where this color is in demand, we recommend Red Bliss. It is one of the very earliest, nearly round, peels without waste and a fine yielder. It is a sure and uniform cropper, a strong grower, is of good size, cooks white and mealy and measures up to every requirement of a first-class first early Potato. Its productiveness and fine quality commend it.

Irish Cobbler. One of the best extra early varieties, with nearly round tubers having slightly indented, well developed eyes when full size. The skin is thin, smooth, and of a yellowish white color. The flesh is pure white and exhibits remarkable cooking qualities. It is an extremely heavy yielder of choicest quality.

Green Mountain. The most popular Potato on earth. Ideal for main crop. A dependable Winter keeper. An excellent baking variety. A reliable medium late Potato that is popular in some sections it has superseded all other main crop varieties. It seems to thrive in all soils and in all localities, making heavy, healthy vines and yielding big crops of large, smooth, white skinned tubers of handsome, flatish oval form. It cooks white, dry and mealy, and well, and is not liable to scab or decay.

Russet. Considered the best late Potato today and as near blightproof as a Potato can be. The tubers are round to oblong and of good size. Flesh is pure white and the skin has a rough, russet appearance.

FIELD AND ENSILAGE CORN

Cornell No. 29-3 Hybrid Dent. Best Hybrid Field Corn for New York and New England. This variety was developed for ensilage on high elevations and husking use on lower elevations. It is from in-breds of Cornell 11, Bloody Butcher, Onondaga White Cap, and Luce's Favorite. The kernels lack uniformity of color and range from white to deep red and ripens in 110 days. Grows tall and somewhat more leafy; matures as early as Cornell No. 11. Has a stronger root system than the open pollinated varieties and therefore less trouble with lodging. Can be used both for ensilage and husking. This variety has become popular throughout New York State and vicinity during the past few years.

New York State Certified Seed

Lancaster Sure Crop. About 110 days. Stalks 8 to 12 ft. high. Ears have broad yellow dent kernels on a red cob.

Cornell No. 11. Matures 100 days. Best for New York State.

Improved Leaming. Yellow Dent. An early, long eared Corn, averaging about 10 in. in length with 18 to 20 rows of deep yellow kernels. A good Corn for silo and extensively grown for that purpose by stock feeders everywhere. Matures in 100-110 days.

Longfellow. For many years a favorite yellow flint variety in New York State. The ears reach a length of 12 to 14 in. and have eight rows. The stalks are taller than Canada and occasionally bear two ears.

Sanford White Flint. An 8-rowed white Flint variety, used to a considerable extent. Resembles Early Canada in all except color.

Early Eight Row Canada. Matures in about 85 days. Ears are medium length with eight rows. Stalks grow 7 to 8 ft. high. A yellow Flint Corn.

AGRICULTURAL SEEDS

Cornell Pasture Mixture (Utility). The seed bed should be prepared by plowing and harrowing, and the seed evenly distributed at the rate of 25 lbs. per acre. Cover the seed not over 1/4 in. deep. For best results sow as early as possible in April. Seeding may be done in May, but Summer and Fall seedings are not recommended. Mow the weeds, if necessary and a light grazing may be allowed in August and September. The mixture contains Kentucky Blue Grass, Canada Blue Grass, Timothy, Mammoth Red Clover, Alsike Clover, Ladino Clover and Red Top.

Timothy (99.60 Pure). As a crop for hay Timothy is probably unsurpassed by any other grass.

Grimm Alfalfa Clover (The Genuine Certified). Has different root system, more hardy than other strains of Alfalfa and can be grown on shallower soil. Sealed and certified bags.

Medium Red (Domestic Grown). This is the common Red Clover, so extensively grown. It is a biennial in most places, living but two years if allowed to seed. It is usually sown early in the Spring on Winter Wheat or with Oats or Barley, but can be sown in July or August. This seed is American grown and the highest grade.

Alsike. Grows well on low, wet land where Red Clover does not thrive. It is a perennial and will last for a good many years, either for hay or in pasture. It makes fine hay of high feeding value and is very valuable in pastures. Seed of highest quality.

Ladino. This type of Clover is used in pasture mixtures with success and is harder than Alfalfa. Can be used as a green feed for poultry. Sow 8 lbs. per acre.

Red Top Fancy. It is a perennial grass with a creeping habit of growth; leaf blades narrow. Red Top is a remarkable grass, accommodating itself to a variety of soils and conditions. It grows well on wet land. It is strongly drought-resistant and flourishes on soils so very poor in lime that most other grasses fail.

Dwarf Essex Rape. A forage plant of great merit. Valuable feed for cattle, sheep and hogs. Sow 10 to 12 lbs. per acre.

Golden Millet. Produces a very fine quality hay and makes a large seed head. One bushel will sow one acre.

Soy Beans, Black Wilson. Valuable for improving the soil. Also good for fodder. Sow in drills 3 ft. apart. Sow 1 to 2 bushels per acre. Bushel (60 lbs.)

Sudan Grass. The most wonderful annual grass ever introduced. Sow 20 lbs. to acre.

Winter Vetch. For forage and fertilizing purposes.

Peas, Canadian Field. Usually sown with Oats. Used both as a green feed and fertilizer.

Seed Oats. Selected varieties of supreme quality.

DON'T WASTE GARDEN RUBBISH—CONSERVE IT BY USING ADCO

Garden wastes, including leaves and grass clippings are too valuable to burn or otherwise destroy. Convert them easily into rich, organic manure by employing **ADCO**, a powder which when mixed with vegetable waste and kept moist gradually converts the material into real manure free from weed seeds. The method of using **ADCO** is simple. Anybody can use it. Spread your farm and garden rubbish (either in a heap on top of the ground, in a large crate, or in a shallow pit) and every time it becomes 6 inches higher, wet it down, sprinkle with **ADCO**, and tramp or tamp it down. Repeat these steps until all the rubbish is used, and at least once, at the end of a month, turn it over. In three months or so you will be rewarded with a fine lot of rich, clean, organic fertilizer.
